IP-Video Monitors Iraqi Elections in UK

Intruder International plc provided IP-CCTV surveillance for the three polling stations in London, Manchester and Glasgow during the recent UK Iraqi elections, as part of the security operation provided by Group 4 Securicor. Due to an extremely tight timescale and the high security surrounding the event, Intruder International was initially given very little specific information and did not know the exact camera locations until the day of the installation. To meet these demanding requirements and provide maximum flexibility Intruder International chose to install IndigoVision's IP-Video technology.

IndigoVision's digital video technology provided high quality live and recorded video, easy PTZ camera control and quick switching between video feeds without the need to install a separate matrix. All of the IP-Video viewing, recording and control was PC based, allowing the system to be easily configured. The user friendly front end also provided a familiar environment for the operators who found the system easy to use with little training.

After receiving the go-ahead on Friday, all three system installations were started on Monday and were fully commissioned and working by Tuesday afternoon – a testament to the flexibility of Intruder International's UK wide operation and IndigoVision's technology. It would have been very difficult to meet this demanding schedule and level of flexibility using a traditional cabled analogue system. This advantage was further highlighted when the election hall at the London, Wembley centre was changed part way through the Election. The entire surveillance system was relocated and re-commissioned within one day.

Each centre typically had 9 static cameras and 1 PTZ camera all connected to IndigoVision's 8000 IP-transceiver modules. These modules transmitted compressed camera video and control data via a network cable routed around the centre, back to the control room, for recording review and live monitoring. The system provided live and recorded 25fps digital video from all cameras at 2CIF resolution, ensuring the operators viewed 'analogue' quality CCTV images at all times.
